

Blacktech Decentralization Master Plan

Blacktech Solutions Corp — Decentralization Master Plan

Full independence roadmap: business, legal, technology, and wealth

Prepared: May 25, 2026
Prepared for: Derrell Black
Classification: Confidential — Internal Use Only
Status: Draft Future Plan — Not Yet Implemented

1. Vision — What Full Decentralization Means for Blacktech

A fully decentralized Blacktech Solutions Corp is a business that: - **Owns its data** (no Intuit/Zapier/Google owns your customer list or books) - **Controls its communication** (no Meta/Facebook/Telegram determines who you reach) - **Holds its wealth** (no bank can freeze your accounts; wealth stored in trusts + crypto) - **Survives platform bans** (no single tech company can shut off your lead flow or payments) - **Remains operational without external approvals** (you register services, manage identity, collect payments, issue contracts — all in-house)

This is digital sovereignty.

2. Current State — Centralized Dependencies

Dependency	Risk Level	Consequence if Cut Off
		Lose business email if account

HostGator email	Medium	flagged
QuickBooks Online	High	Lose accounting records, invoice history
Facebook/Instagram	High	Lose marketing reach, leads dry up
Zapier	Low	Automation stops, but replaced by manual effort
Formspree	Low	Lead forms go down
Telegram	Medium	Lose command center on Pi
Banks	High	Payment processing halts, cash flow freezes
Square/Stripe	High	Card processing removed, no deposits
PayPal	Medium	Payment dispute risk, account freeze
One Talk (Verizon)	Low	Phone transfer lost

3. Target State — Full Decentralized Stack

The ultimate architecture is a **Blacktech Digital Fortress** where the Pi is the nerve center.

A. Finance Layer — Wealth Sovereignty

Current: QuickBooks Online + bank accounts + PayPal/Square

Target: - **Self-hosted accounting** — InvoiceNinja or Akaunting on the Pi - **Crypto payments** — BTCPay Server on the Pi accepting Bitcoin, Lightning, USDC - **Cash-only backup** — Accept checks and cash for privacy-sensitive clients - **Trust banking** — Business Trust holds wealth outside personal name (IRS limit preserved) - **Ledger hardware wallet** — Cold storage for crypto, offline, theft-proof

B. Communication Layer — Censorship Resistant

Current: Email via HostGator + Telegram + Facebook Messenger

Target: - **Primary:** Matrix self-hosted server (homeserver runs on Pi, Synapse) - **Bridge:** Telegram kept as an interface into Matrix, or replaced by Element app - **Email:** ProtonMail Bridge running on Pi for encrypted IMAP, or self-hosted mail (Postfix + Dovecot + DKIM/DMARC management) - **Backup:** Signal (encrypted phone number based, secondary line)

C. Marketing Layer — Platform Independence

Current: Facebook Blueprint + Zapier + Formspree **Target:** - **Social Media:** Mastodon server for Blacktech (own the followers, no algorithm suppression) - **Website:** Pi-hosted static site (Hugo or Jekyll served by nginx) + Cloudflare Tunnel or WireGuard + public IP routing - **Lead forms:** n8n webhooks on the Pi landing directly in your CRM - **SEO:** Local directory listings + Google Business Profile (last centralized holdout because customers search there) - **Email marketing:** Self-hosted Mautic or Listmonk (on Pi, not Mailchimp)

D. Operations Layer — Data Ownership

Current: Google Drive + QBO + external USB drive **Target:** - **Files:** External drive only + Pi as the network file server (SMB/NFS share across home) - **Invoices:** InvoiceNinja on Pi (generate PDF, email, track payments) - **Estimates:** Markdown templates (already working) rendered via InvoiceNinja - **Contracts:** Self-hosted DocuSign alternative (Docassemble or Paperless-ngx on Pi) - **Leads:** Local markdown database + search script on Pi

E. Identity Layer — Business Sovereignty

Current: LLC or sole proprietorship registered in Illinois **Target:** - **Unincorporated Business Trust** holds the business assets (not a corporation) - **Private Family Trust** holds personal assets - **Transactional name** — “Blacktech Solutions Corp” still does business without government entity filing - **Work performed as contractor** to the Trust, not an employee of the State - **Reduces exposure** to forfeitures, license revocations, and regulatory seizures

4. Implementation Phases

Phase 1 — Foundation (Months 1-2) - InvoiceNinja installed on Pi - n8n automation replaces Zapier - ProtonMail secondary account for sensitive correspondence - Physical ledger/hardware wallet purchased for crypto - Website migration to static site on Pi begin

Phase 2 — Communication Lockdown (Months 3-4) - Matrix homeserver deploy on Pi (or second Pi as appliance) - Telegram remains as a bridge into Matrix during transition - Self-hosted Email fully tested and switched over - Signal and Session used for SMS-level encrypted communication

Phase 3 — Marketing Independence (Months 4-6) - Mastodon server for Blacktech (even if small audience at start) - Lead forms fully on Pi (n8n → files on drive) - Mautic or Listmonk

replaces Mailchimp - SEO maximization without dependency on Meta ads

Phase 4 — Finance Sovereignty (Months 6-8) - BTCPay Server operational for Bitcoin and Lightning payments - InvoiceNinja handles all invoices; QuickBooks Online backup data exported - Trust banking established (separate from personal) - Crypto to fiat off-ramp via a Bitcoin ATM or peer-to-peer local sale (until Square adds Bitcoin)

Phase 5 — Full Unplug (Months 9-12) - All centralized services fully replaced or kept only as inactive backup - Business runs entirely on Pi + external drive + Matrix + BTCPay - Zero monthly SaaS dependency; data fully owned - Training for Derrell Black and successors on the decentralized stack

Phase 6 — Resilience + Scaling (Year 2) - Second Pi for redundancy (backup server synced over LAN) - Offsite tape backup of external drive once per month - New revenue streams via smart contracts for warranty deposits

5. Business Benefits After Decentralization

Area	Benefit
Privacy	No third party can scrape your customer list or invoice history
Censorship resistance	Facebook can't take away your audience. Zip-code targeting is yours.
Payment freedom	No bank fee > 1%. Can operate globally without waiting on ACH clearing.
Tax efficiency	Trust structures reduce state-level exposure
Competitive edge	Bold move positions Blacktech early Web3 infrastructure niche

6. Risks + Mitigations

Risk	How to Handle It
Pi hardware failure	External drive + cloud backup; second Pi synced
Power outage at home	UPS backup + eventually offsite Pi

ISP blocks self-hosted mail	Use ProtonMail as mail relay until reputation established
IRS complexity with crypto	Track every transaction; use InvoiceNinja to log BTC as USD value on invoice date
Customer resistance to Bitcoin	Still accept checks/cash; Bitcoin is optional, offered as “modern convenience”
Matrix server takes too many resources	Start with free Matrix account on existing homeserver; migrate to self-hosted when traffic demands it
Technical debt	Document everything; Pi act as “appliance” — not hard to set up once, hard to rebuild from memory

7. Cost Comparison

Category	Current Monthly	Decentralized Monthly	Savings
QuickBooks Online	~\$55	\$0 (InvoiceNinja)	-\$55
Zapier	Free tier	\$0 (n8n)	-\$15
Mailchimp	Small plan	\$0 (Mautic)	-\$20
Formspree	Free/Gold	\$0 (n8n)	-\$10
Cloudflare (free)	\$0	\$0 (or WireGuard = \$0)	\$0
Hosting	N/A	\$0 (Pi + DNS)	\$0
Total SaaS	~\$75+/mo	\$0/mo	- \$75/mo

Hardware upfront cost: Second Pi + UPS + hardware wallet ≈ \$100-150 one-time.

8. Tools Reference Sheet

Old Tool	Decentralized Replacement	Status
QuickBooks	InvoiceNinja / Akaunting	Open source, PHP-based
Zapier	n8n	Open source, Node.js

Formspree	n8n webhook	Open source, on Pi
Mailchimp	Mautic / Listmonk	Open source
Facebook (social)	Mastodon	Self-hosted ActivityPub
Telegram	Matrix + Element	E2E encrypted, self-hosted
Email (HostGator)	ProtonMail Bridge or Postfix	Encrypted or self-managed
Square/Stripe	BTCPay Server	Self-hosted Bitcoin processor
Google Drive	External drive + Pi SMB share	Already mostly done
DocuSign	Docassemble / Paperless-ngx	Self-hosted

9. Why This Matters — For Derrell Black

Every business that depends on a platform (Facebook, QuickBooks, Stripe) lives at the mercy of that platform's terms of service.

A **decentralized** Blacktech means:

- **Nobody can de-platform you** on a Friday evening and leave you without leads or payments.
- **You own the customer relationship** — not Zuckerberg, not Intuit.
- **Your wealth isn't in one bank** — it's in trusts, in crypto, and in business contracts that don't require a state permit to exist.
- **Your kids inherit the business structure** — the Trusts hold it. The Pi holds the data. No third-party gatekeeper.

This is legacy, not just software.
