

Indoor Lighting Upgrades for Commercial and Industrial Facilities

Networked Lighting Controls can reduce the energy consumed by illumination by up to **49%.***

Is an Indoor Lighting Project Right for You?

- Are the existing fixtures in your facility fluorescent or LEDs that are consuming lots of energy and driving up your electric bill?**
- Are the lighting fixtures currently controlled manually with switches?
- Is lighting too bright or too dim in certain areas?

ComEd has incentives available to help customers install and implement Networked Lighting Controls in their facility. **Scan the code below** to see how you can save money and energy.

Benefits

You can lower energy costs and consumption by improving the performance of your indoor lighting system. An authorized Energy Efficiency Service Provider will assist you every step of the way to help your facility optimize its energy use.

Consider these energy-efficiency opportunities:

- **LED Fixtures and Retrofits:** Upgrading your existing fluorescents with high-efficiency LED fixtures can save energy without advanced controls. Instant Discounts also available on DLC listed fixtures
- **Networked Lighting Control (NLC) System:** If fixtures will be used 2,000+ hours a year, an NLC can automate and centralize fixture controls to save even more energy, utilizing strategies such as zone control or high-end trimming
- **Non-Networked Lighting Controls:** If your facility runs fixtures less than 2,000 hours a year, non-networked controls like occupancy sensors or daylighting controls can reduce energy waste
- **Basic Lighting Controls:** Instant Discounts available on basic sensor-enabled fixtures purchased directly from select distributors
